1. Introduction

I started Nailverse because I kept running into the same gap: there was no single place built entirely around nail art, where sellers, nail technicians, and customers could actually connect. This document lays out my vision for Nailverse and the requirements I want built into the platform. I've drawn some inspiration from social-commerce marketplaces such as Meesho, but Nailverse is being shaped around one industry I understand well — nail tech.

Right now, most of the nail businesses I know are run informally — through social media DMs, screenshots, and word of mouth. My goal is to bring real structure to that world through a database-driven marketplace of my own. I want Nailverse to support product listings, seller onboarding, service bookings, secure payments, and order tracking, all backed by a database I can trust to stay consistent, secure, and scalable as the platform grows under my ownership.

2. Objectives

As the founder of Nailverse, these are the objectives I'm building the platform around:

- Offer a user-friendly platform where customers can explore, purchase, and review nail art products and services.
- Facilitate registration for independent sellers and nail technicians, allowing them to list products or services and manage their own storefronts.
- Guarantee secure and reliable payment processing for all product purchases and service bookings.
- Enable efficient order management, appointment scheduling, and shipment tracking.
- Support scalability to accommodate an expanding product catalog, a growing seller base, and increasing user traffic across regions.
- Preserve accurate, consistent, and well-structured data across all modules through sound database design.

3. Major Activities in the System

Here's how I envision Nailverse running day to day, from the moment a seller joins to the moment an order lands on a customer's doorstep:

Seller / Nail Technician Registration & Onboarding

- Business or individual seller registration accompanied by identity and document verification.
- Portfolio submission for nail technicians, including sample designs, certifications, and previous work.
- Storefront setup encompassing catalog creation and service listing.

Customer Registration & Authentication

- User sign-up verified through email or phone number.
- Secure login supported by encrypted password storage.

- Profile management covering address, contact details, and preferences.

Product Browsing & Search

- Category-wise listing of products such as press-on nails, polishes, nail art tools, and extension kits.
- Search functionality equipped with filters for price, brand, rating, and category.
- Product detail pages featuring images, descriptions, pricing, and customer reviews.

Nail Service Booking

- Browsing of available nail technicians alongside their service menu and availability.
- Appointment booking that includes date, time slot, and service in remote for their self learning.
- Booking confirmation, rescheduling, and reminder notifications.

Order Placement

- Add-to-cart and wishlist functionality for products.
- Checkout process incorporating address selection and order summary.
- Order confirmation followed by invoice generation.

Payment Processing

- Multiple payment options, including credit/debit card, UPI, net banking, and digital wallets.
- Secure, encrypted transaction processing.
- Payment confirmation accompanied by digital receipt generation.

Shipment & Delivery Tracking

- Integration with logistics partners to facilitate product delivery.
- Real-time tracking of order and shipment status.
- Notifications covering dispatch, transit, and delivery updates.

4. Functional Requirements

These are the core modules I need Nailverse to have from day one:

Module	Functionalities
Customer Management	Registration, login, profile update, password reset
Seller / Technician Management	Seller onboarding, document verification, storefront setup, portfolio management
Product Catalog	Add/view products, search, filter, product detail management
Service Booking	Browse technicians, check availability, book/reschedule/cancel appointments
Shopping Cart	Add/remove items, update quantity, save for later
Order Management	Place order, generate invoice, cancel/return orders
Payment Gateway	Process payments, validate transactions, generate receipts

Module	Functionalities
Shipment Tracking	Track order status, notify customer, update delivery information
Reviews & Ratings	Submit and view product/service reviews, rate sellers and technicians
Admin Panel	Manage products and sellers, monitor orders and bookings, handle disputes, view reports

5. Non-Functional Requirements

Beyond features, these are the standards I hold Nailverse to as its owner:

- **Performance:** Rapid response time for browsing, search, checkout, and booking operations.
- **Security:** Data encryption, secure payment gateway, and protection of user and seller information.
- **Scalability:** Capacity to accommodate an expanding product catalog, a growing number of sellers, and concurrent users.
- **Reliability:** Consistent uptime and error-free transaction and booking processing.
- **Usability:** Simple, intuitive interface suitable for customers, sellers, and technicians of varying technical proficiency.
- **Availability:** The platform should remain accessible with minimal downtime, particularly during peak shopping periods.

6. Conclusion

Nailverse is my answer to an industry I care about that's still operating without the tools it deserves. With this platform, I want to give the online nail art and beauty world a comprehensive, database-driven home — one that brings real structure and scalability to a market that currently runs in a largely informal way. By owning and building out seller onboarding, product sales, service bookings, secure payments, and order tracking within a single, well-designed database, I intend for Nailverse to deliver genuine convenience for customers while opening up real growth opportunities for the sellers and nail technicians who join me.

This requirement analysis is the foundation I'll be building on — it's what guides the entity-relationship design, schema development, and implementation phases ahead, and it keeps me accountable to the vision I've laid out here as Nailverse's founder and owner.
